

**Importer Pro is a powerful utility that is used when applications require the importing of data and/or images, processing COLD or print spool files, performing system conversions, interfacing with multi-function devices, communicating with multiple servers, or polling network folders. Importer Pro can operate unattended and automatically upload content**

## One program, unlimited uses

Importer Pro can be set up with multiple configurations that can import from multiple sources. An Importer Pro configuration file contains all the job specifications required to perform a required task to import, manipulate, and commit the data or content to a FileBound server. Using multiple configuration files allows Importer Pro to monitor multiple locations and then perform the configured tasks on the data when available. This data can be actual files, images, or a data file that contains only index information. Importer Pro can also import COLD (print spool files) data that has been generated and exported from another system. Importer Pro can be setup to process a COLD file, to extract index information and then automatically upload to a FileBound server. Importer Pro has the ability to add custom scripting to the configuration files which triggers preprocessing of the incoming files prior to selection of the appropriate configuration, processing, and commitment to the FileBound server.

Importer Pro is truly a robust and configurable tool. Whatever your Content Management processing needs, Importer Pro can deliver.

- » COLD or Print Spool file processing
- » Verifying and validating input and output data
- » Constant polling of servers for inbound images, faxes and other pertinent information
- » Multi-function devices support and integration
- » Image system to image system conversions
- » Unattended uploading into FileBound

## COLD Processing

The "COLD" capabilities are used to set up and configure Importer Pro to import print spool files. Importer Pro can have an unlimited number of configurations. When a COLD feed is processed, a CSV file and multiple .txt files are created by the utility. These files are then imported into FileBound. This utility will allow a user to set up a process to parse the COLD feed, extract the index data, and upload the processed results.

## Visual Basic Script

Importer Pro provides the ability to add VB Scripting to customize the manipulation and processing of incoming data and/or content. VB Script can be added to perform data input/output verification, specified data manipulation functions, OCR or Barcode recognition, external data match/merge, or many others. These functions can be named and added to multiple configuration files.
